1. Writing in Typst

Basic markups

- `_text_` → *text*
- `*text*` → **text**

- `= Text` → heading of 1st lvl.
- `== Text` → heading of 2nd lvl.
  - etc.

- `+` → numbered list's item.
- `-` → bulleted list's item.
- Use tabbing to create sublists.

Adding pictures

`#image("picture.jpg")` – pastes the picture. Typst understands only relative paths.

`#image("picture.jpg", width: 50%)` – twice less wide as the text.

`width: 1cm` – 1cm wide.

To create a figure with a caption, use:

```
#figure(
  image(...),
  caption: [
  ...
  ],
)
```

`<example>` – creates a label.

`@example` – creates a reference.

Bibliography

`#bibliography("file.yml")` – uploads a bibliography. **Click here** to know more about the `.yml` format.

`@<key>` – makes a reference to a bibliography entry.

Math

`$text$` – in-line math.

`$ text $` – displayed math.

`$..."text"...$` – plain text inside math mode.

Functions don't require # in math mode.

`(...)` – either creates parentheses or makes a group.

`$beta$` $\longrightarrow \beta$; `$Beta$` $\longrightarrow \mathrm{B}$; `$epsilon$` $\longrightarrow \varepsilon$; `$Epsilon$` $\longrightarrow \mathrm{E}$; `$nabla$` $\longrightarrow \nabla$.

`$x_a^b$` $\longrightarrow x_a^b$; `$x_(a b)^(c d)$` $\longrightarrow x_{ab}^{cd}$.

`$sum$` $\longrightarrow \sum$; `$integral$` $\longrightarrow \int$.

`$a arrow.squiggly b$` $\longrightarrow a \rightsquigarrow b$.

`$a/b$` $\longrightarrow \frac{a}{b}$; `$(a+b)/(c+d)$` $\longrightarrow \frac{a+b}{c+d}$; `$(x(x+1))/(x+1)$` $\longrightarrow \frac{x(x+1)}{x+1}$.

`$cal(N)$` $\longrightarrow \mathcal{N}$; `$vec(x_1, x_2, x_3)$` $\longrightarrow \begin{pmatrix} x_1 \\ x_2 \\ x_3 \end{pmatrix}$.

To put a math symbol inside text mode, use `#sym.<symbol>`. To look at available symbols, **click here**. To find a symbol by its appearance, use **Detypify**.

Questions

1. Explain functionality and syntax of `#bibliography` function.

2. How to make an *italicized text*? a **bold text**?
3. What're the outputs of the following codes: `$Beta$`, `$integral$`, `$x^b_a$`, `$arrow.squiggly$`, `$(x(x+1))/(x+1)$`, `$cal(N)$`, `$vec(x_1, x_2, x_3)$`?
4. What is the function of = markup? Of == markup? Of ===, etc.?
5. How to make a numbered list? A bulleted list? A sublist?
6. What're the syntax and function of the `#image` command?
7. Explain the following constructions: `$...$`, `$ ... $`, `$..."text"...$`
8. How to add a caption to the picture?
9. How to make a heading of 1st level, 2nd level, 3rd level, etc.?
10. What's the purpose of `#sym.<...>` construction?
11. How to make a label? How to refer to it?
12. What're the 2 different roles parentheses can play in the math mode?
13. What're the functions of `*...*` and `_..._` markups?
14. How to change a width of the picture? How to make it 25% of the text width?
15. How to make a bibliography? Which file extension does it have? How to upload a bibliography to the main file? How to refer to a bibliography's item?
16. How to paste an image into the main file? How to control the picture width?
17. What's the point of `@<...>` and `<...>`?
18. How to put a math symbol into text mode?
19. How to make an inline math? Displayed math? A plain text in the math mode?
20. Which delimiters we use to group objects in math mode?
21. What's the point of + and - markups? Why do sometimes they require tabbing indentation?
22. What do functions lack in math mode? Give an example of a math-mode function.
23. What's a `.yml` file?
24. Give code to product these outputs: β, x_{ab}^{cd}, $\sum$, $\to$, $\frac{a+b}{c+d}$.

25. What're the syntax and functionality of `#figure` function?
26. How to find a code for a math symbol (2 ways)?
